

Condition 3: Bounded Process AI

AI Bounded Process use declaration

Required for all Condition 3 assessments — not graded, but reviewed

This document allows your marker to judge your authorship, your decision-making, and the quality of your critical engagement with AI. It is not used to reward AI use. It is used to assess whether you remained the author and final decision-maker. A concise, honest, and specific account is more useful than a long but vague one.

Part A: Student Details

Student name: Tung Duc Nguyen

Student number: S4275232

Course code and name: [COSC2531](#)

Assessment number & title: Assignment 1: Individual assignment

AI bounded process allowed in this assessment: Section 6 and 7

Date submitted: 30/08/2026

Part B: Account of AI Use

Complete all five fields below for each AI tool you used. If you used more than one tool for different purposes, copy this section for each. If you did not use any AI tool, complete Part E only.

I have used AI for surface-level support. Here are the details of my use.

1. Tool used:

Name of the AI tool and version if known — e.g. ChatGPT GPT-4, Microsoft Copilot, Gemini 1.5

Val (OpenAI GPT 5.6 LUNA)

2. Purpose of use:

What specific process task were you allowed to use this tool for? e.g. brainstorming section headings; generating alternative code approaches; receiving feedback on my argument structure; obtaining debugging hints

I was allowed to use Val only for step 6 (View group tables) and step 7 (Determine winners) of the assignment.

- For step 6, I used it to research how sorting works in Python so I could justify my chosen method in code comments, as the brief required.

- For step 7, I used it to help me think through how to check that every team in a group had played all 3 of its round-robin matches before determining the top 2 qualifying teams, and how to combine qualifiers from multiple groups into a single list.

3. What the AI produced:

Briefly describe the output the AI gave you. e.g. A list of five possible section headings / Three alternative function implementations / Written feedback on two paragraphs / A hint about the bug location

- For step 6, Val explained Python's built-in `sorted()` and `.sort()`; where `sorted()` returns a new list while `.sort()` changes the list in place, and that both accept a key function to sort by a chosen field as well as a reverse argument for descending order.
- For step 7, Val suggested representing each team as a dictionary and each group as a list of those dictionaries and produced a `rank_group()` function that checks if the group has exactly 4 teams, uses `all()` to confirm every team has `matches_played == 3`, and sorts with `sorted()` using a descending multi-part key (points, then goal difference, then goals for) to return the top 2 teams.

4. What I did with that output:

Describe what you accepted, rejected, revised, or rewrote — and why. e.g. I rejected two suggestions as irrelevant to the brief. I significantly revised one heading to better match my argument. I rewrote the function logic independently after seeing the AI version.

- For step 6, I compared the sorting options Val explained (a manual algorithm versus Python's built-in `sorted()`/`.sort()`) and chose to use the built-in `sorted()` with a key function and I wrote my own justification for this choice in my code comments.
- For step 7, I did not use Val's `rank_group()` function directly. Instead, I wrote my own completion check as an explicit loop over each team's matches-played count and reused the same sorting approach from step 6 to rank each group before selecting the top 2 teams and combining them into a single qualifiers list, matching the specific structure of my own `group_records` and `matches` data.

5. How it influenced the final submission:

Which specific section or stage of the submission was affected, and to what extent? e.g. AI influenced the section headings in Part 2, but the content under each heading is entirely my own. The final decisions, interpretation, and submitted work are mine.

It influenced steps 6 and 7 of my submission.

- For step 6, Val's explanation led me to use Python's built-in `sorted()` with a key function instead of writing my own sorting algorithm by hand, and I documented that choice and my reasoning in the code comments as the brief required.
- For step 7, Val's suggestion of checking match completion before ranking, and of combining results from multiple groups into one list helped shaped the overall structure of my `determine_winners()` function, but the actual logic (the completion check, the sort key, and how qualifiers are collected and displayed) was written independently to fit my own data structures and menu-driven program.

Part C: Additional AI Use (if applicable)

If you used a second AI tool for a different purpose, complete the fields below. Delete this section if not needed.

Tool used:

Name and version

Purpose of use:*What specific process task?*

What the AI produced:*Brief description of the output*

What I did with that output:*What did you accept, reject, revise, or rewrite — and why?*

How it influenced the final submission:*Which section, and to what extent?*

Part D: Before-and-After Sample (if applicable)

If the AI changed any text or code directly — for example, if you accepted a revised sentence, corrected code, or edited paragraph — attach a brief before-and-after sample below. This is required where AI directly altered submitted text or code. It is not required if AI was used only for brainstorming or outlining that you then developed independently.

Before (original text or code, before AI was applied):

Aside from manually sorting data in Python using lists and dictionaries with basic data structures, what other ways can we sort data in Python? are there any built-in functions?

Below was my step 6's manual sorting.

```
team_list = list(group_records[group])
n = len(team_list)
for pass_num in range(n - 1):
    for i in range(n - 1 - pass_num):
        current_key = (team_list[i]['Pts'], team_list[i]['GD'], team_list[i]['GF'])
        next_key = (team_list[i + 1]['Pts'], team_list[i + 1]['GD'], team_list[i + 1]['GF'])
        if current_key < next_key:
            team_list[i], team_list[i + 1] = team_list[i + 1], team_list[i]
sorted_teams = team_list
```

After (text or code as submitted, following AI-assisted editing or suggestion):*Paste or type the final version here*

After I implemented sorted() for step 6

```
sorted_teams = sorted(group_records[group], key=sort_items, reverse=True)
```

Annotation: what changed, and what did you decide independently?*Describe what the AI suggested, what you accepted or modified, and what remained your own decision***Part E: Declaration**

Select all that apply and sign below.

☐ I did not use any AI tool in the preparation or submission of this assessment.

or

☐ I used AI only for the process purposes explicitly permitted in the task instructions.

☐ I remained the author and final decision-maker throughout this assessment.

☐ The account I have provided above accurately and honestly describes how I used AI in this task.

☐ I take responsibility for the quality, accuracy, integrity, and final form of the submission.

☐ I understand that my assessor may ask me to explain or discuss my work and my AI use, and that I am expected to be able to do so without reference to AI-generated material.

☐ I understand that using AI beyond the permitted scope, or failing to declare AI use where required, may result in a mark reduction or referral for academic integrity review.

This document is not used to reward AI use. It is used to judge your authorship, your decision-making, and the quality of your critical engagement. Aim for quality of reflection, not length. A specific account of one genuine interaction with AI is more useful to your marker than a vague account of many.
